

TrueSight for Multi-Cloud

Optimize performance and control cost

PRODUCT DESCRIPTION

TrueSight solutions plan, run, and optimize multi-cloud infrastructure, applications, and services, accelerating innovation through greater operational efficiency. With visibility from bare metal to end user experience, IT can plan and optimize resource usage, performance, and cost based on business policy and service demands.

BUSINESS CHALLENGE

Organizations are rapidly adopting cloud computing to accelerate innovation and reduce costs. With technology buyers both inside and outside of IT, **the adoption of cloud services has created new challenges for IT, such as cloud infrastructure overspending, application performance problems, and staff inefficiencies.** For IT organizations to achieve the agility and cost efficiency required for high quality of service and faster time to revenue, they need visibility into infrastructure utilization, application performance, and IT capital and operational costs across their multi-cloud environment.

BMC SOLUTION

TrueSight provides control of IT infrastructure resources and costs, application performance, and end user experience for multi-cloud environments and applications. With visibility across the IT estate and the use of algorithmic analytics, application and IT infrastructure owners gain the insight to plan and manage IT infrastructure services and cost based on business priority and operational requirements.

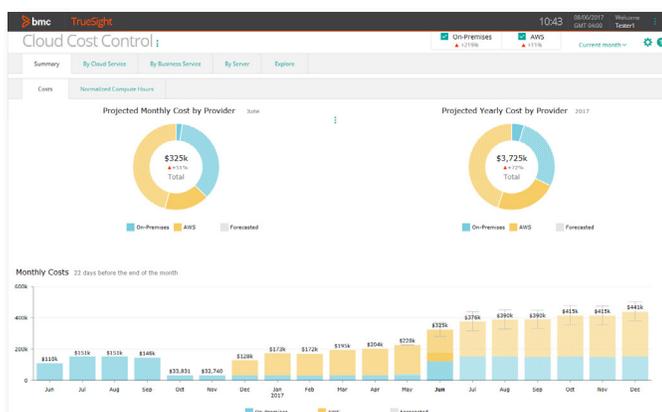

KEY FEATURES

TrueSight provides multi-cloud infrastructure optimization and cost management.

- **Visibility and insights** into infrastructure usage and optimization
- **Automated tracking and forecasting** of multi-cloud infrastructure costs
- **Algorithmic analytics (AIOps)** that improve multi-cloud performance

KEY BENEFITS

- **Defer or eliminate capital expenditure by up to 30%** by increasing density of compute resources
- **Find and fix problems by up to 10 times faster**, reducing staff time spent resolving problems
- **Manage cloud-based, on-premises, and hybrid applications** from a single user interface

- Track on-premises and public cloud infrastructure costs, and forecast future costs.

PRODUCT DETAILS

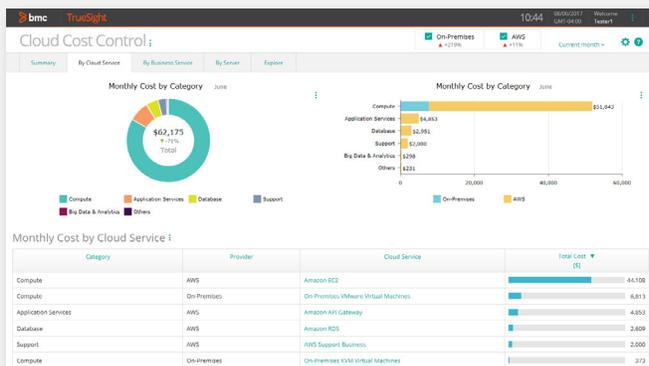

TrueSight provides digital service performance and cost management for multi-cloud environments and applications that elevates IT operations to meet business demands and enable innovation.

- **Plan** for resources needed based on the current and future applications and workloads with visibility across on-premises and public cloud infrastructure. Understanding the on-premises resources utilization and remaining capacity is important to having the context needed for making the best placement decisions, on-premises or public cloud, based on available resources, cost, and business needs.
- **Migrate** applications and workloads from on-premises to public cloud. Based on historical trends of on-premises resource usage for workloads and applications, model the size and type of public cloud infrastructure services needed.
- **Cost management** is essential for multi-cloud environments. With insights into both on-premises and public cloud costs, you can compare cost of infrastructure between on-premises and public cloud, and between cloud service providers. Track, forecast, and report infrastructure costs and keep finance and business owners informed.

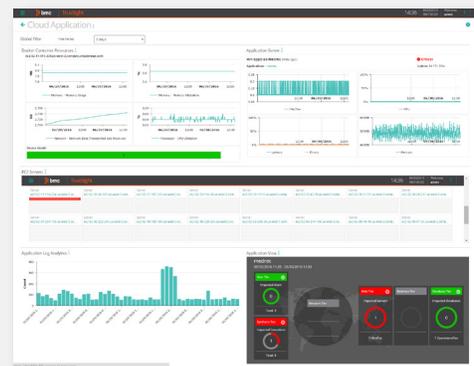

- **Performance** is a differentiator for digital services. Whether the application is run on-premises or in a public cloud, visibility, proactive problem identification, and predictive analytics deliver the insight and automation for consistently meeting service level agreements. With an application-centric view that provides infrastructure, code level, and end user response monitoring, customer expectations are continually met.
- **Service improvement** occurs through algorithmic IT operations (AIOps). By correlating and analyzing operational, service, and machine data, actionable insights that lead to ongoing improvements in performance and service delivery are visible to functional owners and stakeholders. Automating actions for maximum efficiency in areas such as problem resolution, application migration to public cloud, optimizing resources and moving applications to lowest priced public services increase efficiencies and reduce cost.
